

ABOVENET Seattle, WA

Lamb provided Planning, Design, and Construction services for this 12,600 s.f. facility in Seattle for AboveNet, a leading provider of fiber optic network systems. This facility is a central hub for other AboveNet Point of Presence (POP) locations.

Its location in an existing office building being converted to telecommunications operations presented unique structural limitations. Lamb reconfigured the space on the 12th floor to accommodate an uninterruptible power system with a DC power plant, a redundant mechanical system, and a layout that provides easy modification of fiber optic feeds and co-located equipment.
